OPEN AGENT HACKATHON 2026 · DRAFT PROOF

Find funding you can defend.

Grantline turns a nonprofit's grant list into a **source-linked shortlist** and an exportable decision trace.

A grant match needs reasons.

Input

Organization region, focus, funding need, and grant records with source links.

Decision

Check date, region, focus, amount, source, and duplicate identity. Rank the survivors.

Output

Candidate and exclusion cards show each rule and the linked source.

Trace

Export every decision as JSONL for review and correction.

Missing evidence fails closed. A match is a lead, not proof of eligibility.

WORKING LOCAL DEMONSTRATION

Two leads. Three exclusions.

Five **fictional** grant records exercise the review. The agent returns two candidates and three exclusions with five trace records.

Six local tests pass. The browser flow and source-linked output work. Users can also import their own CSV or JSON list.

Open sponsor checks remain.

Zetaris

A private read-only grant-view import is wired. No live instance call is verified.

Meterless

The decision-trace design follows its public reference. Runtime use is not verified.

Cursor

Local sign-in stops at a human check. Authenticated use is not verified.

Entry

Entrant ties, public video, and platform receipt remain unverified.
